This is one very long sentence trying to get opencv working, only the checkboxes need to be verified if the are checked or not.

I was able to find most of the checkboxes but not all of them. Would it be possible to use an overlay or should I use a different setting. I don't need to analyze the other items on the page.

I was thinking, maybe I could use one or two logos to identify the location of the page and then zoom in or use an overlay to reduce the area to search in just for the checkboxes, by doing this to reduce false positives.

Only problem is that humans check of these boxes….
